30 Pages

4,998 Words

30,582 Characters

32% detected as AI

The percentage indicates the combined amount of likely AI-generated text as well as likely AI-generated text that was also likely AI-paraphrased.

Caution: Review required.

It is essential to understand the limitations of AI detection before making decisions about a student's work. We encourage you to learn more about Turnitin's AI detection capabilities before using the tool.

Detection Groups

13 AI-generated only 32%

Likely AI-generated text from a large-language model.

0 AI-generated text that was AI-paraphrased 0%

Likely AI-generated text that was likely revised using an AI-paraphrase tool or word spinner.

Disclaimer

Our AI writing assessment is designed to help educators identify text that might be prepared by a generative AI tool. Our AI writing assessment may not always be accurate (i.e., our AI models may produce either false positive results or false negative results), so it should not be used as the sole basis for adverse actions against a student. It takes further scrutiny and human judgment in conjunction with an organization's application of its specific academic policies to determine whether any academic misconduct has occurred.

Frequently Asked Questions

How should I interpret Turnitin's AI writing percentage and false positives?

The percentage shown in the AI writing report is the amount of qualifying text within the submission that Turnitin's AI writing detection model determines was either likely AI-generated text from a large-language model or likely AI-generated text that was likely revised using an AI paraphrase tool or word spinner.

False positives (incorrectly flagging human-written text as AI-generated) are a possibility in AI models.

AI detection scores under 20%, which we do not surface in new reports, have a higher likelihood of false positives. To reduce the likelihood of misinterpretation, no score or highlights are attributed and are indicated with an asterisk in the report (*%).

The AI writing percentage should not be the sole basis to determine whether misconduct has occurred. The reviewer/instructor should use the percentage as a means to start a formative conversation with their student and/or use it to examine the submitted assignment in accordance with their school's policies.

What does 'qualifying text' mean?

Our model only processes qualifying text in the form of long-form writing. Long-form writing means individual sentences contained in paragraphs that make up a longer piece of written work, such as an essay, a dissertation, or an article, etc. Qualifying text that has been determined to be likely AI-generated will be highlighted in cyan in the submission, and likely AI-generated and then likely AI-paraphrased will be highlighted purple.

Non-qualifying text, such as bullet points, annotated bibliographies, etc., will not be processed and can create disparity between the submission highlights and the percentage shown.

BPP Coursework Cover Sheet

Programme	MSc Management
Module name	Strategic Innovation and Entrepreneurship
Student Reference Number (SRN)	
Report/Assignment Title	RenewWaste: A Digital, Incentivised Recycling Platform for Urban Households and SMEs in Lagos, Nigeria
Date of Submission <i>(Please attach the confirmation of any extension received.)</i>	

Declaration of Original Work:

- ☐ I hereby declare that I have read and understood BPP's regulations on plagiarism and that this is my original work, and that I have researched, undertaken, completed and submitted in accordance with the requirements of BPP School of Business.
- ☐ I declare that where I have used any AI tools, it was for the following reasons (highlight as appropriate):
 - ☐ To review a draft
 - ☐ To correct language errors
 - ☐ Other (please describe)

- ☐ I have copied & retained for BPP University's reference all AI prompts used in the creation of AI content and all AI-generated responses in support of my assignment and attached relevant evidence in the appendices.
- ☐ I understand that I may be required to participate in a *viva voce*, where I will be questioned on any aspect of my assignment, including key concepts, theories, examples used, & any sources included.
- ☐ The word count, excluding contents table, bibliography and appendices, is ____ words.

Overview - Summary of business idea and purpose of the report

The business concept involves a digitalised and incentivised recycling system for middle-income groups and SMEs in the city of Lagos, a context in which municipal solid waste management is a major problem. Lagos produces some 13,000-15,000 metric tonnes of waste per day, but the systems for formal waste disposal are still underdeveloped, and public participation is weak (Opanuga, 2025). While the platform does raise awareness of sustainability concerns and the need for waste recovery efficiency, it also faces the potential of being too simplistic and failing to address structural issues like low trust in digital systems, inconsistent infrastructure, and the dominance of informal waste collectors. In addition, research findings indicate that awareness of the environment does not automatically lead to sustainable waste behaviour in developing countries. Therefore, the venture shows environmental and commercial promise, but if it is to be viable, the behavioural, technical, and operational realities must be integrated. This report analyses the venture's feasibility and its strategic sustainability.

Section 1: Personal Purpose and Entrepreneurial Motivation

Using Sinek's Golden Circle model, the 'why' is to tackle the problem of chronic waste management failures in Lagos, the 'how' is a digital and incentivised recycling programme, and the 'what' is the establishment of formal waste collection services for middle-income groups and SMEs. The purpose is personally relevant as the exposure to inadequate waste disposal practices and the sight of environmental degradation in Lagos is identified by the waste collection system, and the absence of participation of the population in recycling programs. Therefore, the project embodies both a professional interest in sustainable urban development and a personal drive to make a difference in more efficient environmental practices. However, while the Sinek model illuminates an organisation's intent, it is attacked for failing to recognise that purpose is not enough to lead to adoption and commercial success. Practically, the combination of infrastructural deficiencies and lack of trust in formal systems can affect the link between purpose and behaviour change.

It is more apparent when viewed from entrepreneurial motivation theories. Push-Pull theory proposes that entrepreneurial activity occurs when there is an opportunity recognition as well as contextual pressures. In this scenario, the venture is driven by pull factors (perceived gap in recycling service) and push factors (institutional inefficiency, bad municipal waste practices in Lagos) (Etim, 2024). Although this hybrid motivation creates more context relevance, Glinik et al. (2024) state that socially motivated ventures tend to face a challenge combining environmental goals with commercial viability. Consequently, although the business is mission-oriented, its sustainability relies on the ability to create financial profitability from customer demand, which stems from the value of the environment.

Additionally, entrepreneurial skills are needed, other than motivation alone. Drencheva et al. (2022) attribute entrepreneurial dimensions (opportunity recognition, resource mobilisation, resilience, and strategic networking) to critical factors for the success of a venture. Opportunity recognition is also relevant because the business sees an opportunity in the waste systems in Lagos, not being efficient. This is, however, an assumption that informal waste collectors are not dominant and that market gaps are easily exploitable. Likewise, resource mobilisation is a key to partnering, technology, and funding, but financial and institutional support is still limited in emerging economies. Therefore, while these skills enhance the concept of a business, they are constrained by environmental circumstances in terms of implementation.

However, the venture highlights the link between personal purpose, entrepreneurial motivation and sustainability-based innovations. However, the impact of these factors requires them to coincide with the realities of operations, customers, and institutions. If it is not aligned, the embedding of purpose and entrepreneurial skills remains an ambition instead of being commercially viable.

Section 2: Market Opportunity and Value Proposition

2.1 Market Opportunity

The Waste Management sector is a large market segment with structural limitations in Lagos. In Lagos, waste generation rate ranges between 13,000 and 15,000 metric tons; however, a small percentage of recyclable waste is collected through the formal waste management system (Etim et

al., 2024). While this represents considerable unexploited potential, Musakabantu et al. (2026) suggest that the volume of waste doesn't create a sustainable market without effective waste recovery methods and user engagement. Thus, the opportunity is not only related to the availability of waste, but also to the levels of infrastructural and behavioural inefficiencies that need to be addressed.

Table 1: Market Opportunity

Segmentation Type	Target audience
Demographic	Middle-income households (150k-500k (naira)/month), SME owners
Geographic	Ikeja, Yaba, Surulere, Lekki (Lagos mainland)
Psychographic	Environmentally aware, convenience-driven, tech-literate
Behavioural	Currently spend more than five thousand naira per month on waste disposal.

However, target market segmentation is still too generic and needs to be narrowed down. The term 'middle-income households and SMEs' is poorly defined and is uninformative for strategy. A more critical segmentation points out various user profiles. The main segment for households is the time-constrained, dual-income, urban people, like those in Ikeja and Lekki, who waste based on convenience instead of environmental care. In the case of SMEs, the segment of concern refers to small-scale commercial operators that have regular waste streams that can be recycled, and where decisions are made based on cost-efficiency and service reliability. This sophisticated perspective contradicts common notions that green awareness and care are key drivers of adoption.

While Lagos has more than 3 million households and has a high density of SMEs (Bassey, 2025), the participation in recycling is low, with waste being disposed of primarily for convenience, with little sorting unless there is immediate value (Quartey et al., 2025). This indicates that the barriers for the adoption of sustainability are not only a lack of awareness but also behavioural inertia. Market entry also makes things difficult due to the presence of informal waste collectors who manage adaptive and community-integrated low-cost systems (Oh and Hettiarachchi, 2020). These actors are not only competitors but also legitimate and scalable players who are deeply involved. Roberts-Lombard and Jaiyeoba (2025) also state that trust and service reliability are more

important than incentives or awareness in determining participation. Thus, commercial opportunity depends on changing behaviour, reliability and on integration with the existing formal and informal waste system, rather than technology alone.

2.2 Value Proposition

Figure 1: Value Proposition Canvas Summary

The proposed value proposition aims to solve the problem of inefficient waste disposal by implementing a digital, incentivised recycling platform. It is, however, largely based on the assumption that customer realities align with those captured in the Value Proposition Canvas (VPC) (Osterwalder et al., 2014). From the customer's point of view, important “jobs” would be ease of disposal, reliability of pick-up services and cost-effectiveness, while main “pains” would be inconsistent service, health impact from pollution and lack of accountability (Eshete et al., 2023). While the platform reacts to these by programmed collections and rewards, the literature that currently exists shows that such functional solutions are not enough to generate value in emerging market contexts.

The Value Proposition Canvas (VPC) has one major drawback: it assumes that customers act rationally and are interested in better services, but this assumption has not yet been thoroughly empirically tested. In Lagos, the recycling is more influenced by the ease of participation, habit, and trust than by a clear value proposition. In contrast, Faiz et al. (2024) suggest that factors associated with operational reliability and trust are more powerful in driving adoption than digital sophistication, thus highlighting a challenge in the platform's value proposition. If collections are irregular, so are incentives and digital features. In addition, Asih et al. (2026) show that financial incentives are not effective enough to encourage long-term recycling in an urban setting. This is

further complicated by informal waste collectors who offer reliable services that are flexible and inexpensive (Simpson et al., 2024). Hence, the value proposition should not only include incentives and functionality, but also trust building, behavioural reinforcement and linking to existing informal systems to ensure successful adoption.

Section 3: Business Model and Strategy

The recycled business could be seen as a mixed social-commercial model in the dense waste management system of the Lagos region. The model aims to create revenue from material recovery and recycling, subscriptions and partnerships, as well as providing environmental and social value. However, hybrid models have an inherent strategic tension - seeking social impact can come at a price to financial sustainability, especially in markets where price sensitivity and infrastructure constraints are a problem (Nair, 2022). Therefore, while the enterprise shows a commitment to sustainability, the long-term sustainability of the company is dependent on the ability to create a sustainable commercial future from the environmental value.

One important caution in this model is that it does not provide enough clarity around social and commercial objectives being balanced in practice. This balance is not an easy thing to achieve and relies on efficiency of logistics, cost and revenue optimisation. In this context, informal waste collectors' associations play a crucial role. These actors already have networks for collecting, trust at the local level, and are flexible in operation. Their integration as commissioned agents or micro-entrepreneurs in the platform can lead to a cost reduction, greater accessibility of service, greater trust of users, and a combination of social inclusion and commercial efficiency. If that is not done, there's a danger of duplication of infrastructure and opposition from established informal systems.

Moreover, the business cannot be defined as a disruptive venture. Informal waste systems in Lagos are already efficient in their context, providing low-cost, adaptive waste services. Therefore, the business can be viewed as a “reconfigurative” innovation, which formalises and coordinates existing activities, rather than replacing them. This distinction is important because it can help avoid unrealistic scaling assumptions and strategic misalignment due to an overestimation of disruption potential.

The Business Model Canvas (BMC) (Osterwalder and Pigneur, 2010) was adopted to organise value creation by the stakeholders, demonstrating the need for partnership, logistics, incentives and operational cost dependencies. However, the sustainability of the model relies on learning from actual circular economy initiatives, where success is linked to diversified revenue streams, operational efficiency and the level of support by stakeholders. While the BMC offers strategic clarity, it is a fixed structure that is unable to fully articulate the nature of behaviour change, informal competition and infrastructural instability in the city of Lagos. The business should be considered as a learning system that must be constantly tested, learned, and adapted to maximise social impact, whilst maintaining commercial sustainability.

Figure 2: Business Model Canvas Summary

Section 4: Financing Strategy

A realistic financing strategy should be based on clear cost and revenue estimates, rather than on rosy forecasts. As illustrated in Table 1, staffing, logistics, and incentives for users are the highest costs of the venture, which shows the operational intensity of waste collection systems in Lagos.

Table 2: Estimated Costs (First 6 Months)

Cost Type	Item	Monthly Cost (₦)	6-Month Total (₦)
Fixed Costs	App development	300,000	1,800,000
	Staff salaries	400,000	2,400,000
	Office/Admin	100,000	600,000
Variable Costs	Logistics	250,000	1,500,000
	Marketing	150,000	900,000
	User incentives	200,000	1,200,000
Total Costs		1,400,000	8,400,000

The total projected cost of 8,400,000 naira for 6 months underscores the high resource cost and the operational efficiency of the model.

These costs need to be evaluated in terms of revenue feasibility. The projected revenues come from the SME subscriptions, sales of recyclables, and strategic partnerships, as indicated in Table 3.

Table 3: Estimated Revenue (First 6 Months)

Revenue Stream	Monthly (₦)	6-Month Total (₦)
SME subscriptions	500,000	3,000,000
Recyclable sales	400,000	2,400,000
NGO/brand partnerships	300,000	1,800,000
Total Revenue	1,200,000	7,200,000

Despite the diversification, total revenue is still insufficient to cover total costs, leading to a negative result as seen in Table 4.

Table 4: Financial Position (First 6 Months)

Metric	Value (₹)
Total Costs	8,400,000
Total Revenue	7,200,000
Net Position	-1,200,000

The projected loss is normal for such enterprises, but serves to illustrate the financial fragility of the model. One of the biggest challenges is the lack of contingency planning, because the forecasts are based on steady customer growth and operational stability. Practically, losses may be substantial due to delays in adoption or logistics issues. To minimise this risk, the enterprise should scale up when there is demand, and try to scale down fixed overheads by having flexible staffing and/or operating in the right areas with high population. Break-even is expected within a 9–12-month period, but this seems optimistic without a backup plan. In the case of a shortfall in revenue, the company might be forced to cut incentives, adjust pricing, or invest in more profitable partnerships. While bootstrapping and grants are valuable sources of early-stage funding, over-grant funding leads to strategic uncertainty and poor market alignment. Hence, a multi-faceted financing approach using impact investors, crowdfunding and blended finance is needed to enhance long-term financial sustainability and financial resilience.

Section 5: Route to Market

To critically assess the route-to-market strategy, a direct-to-consumer (D2C) and partnership-based approach needs to be benchmarked in terms of cost, scalability and behavioural alignment. D2C models benefit customers by providing better access to their information, and they benefit managers by increasing their managerial aspects over service quality, communication, and decision-making, which can improve service responsiveness over time (Kalayci et al., 2024). However, it is not without a price. For RenewWaste, a D2C approach would demand significant up-front investment in customer acquisition, logistics, and trust-building, a time when funds are scarce.

On the other hand, Partnership-based routes help lower entry barriers through using existing networks like local waste collectors, SMEs, and community groups. In emerging markets,

intermediaries can also reduce the transaction costs and facilitate market entry since they already know and operate in the local environment (Rahman et al., 2023). This is particularly important in Lagos, where the informal waste systems already offer accessible and low-cost services. Consequently, Partnerships can be a way to gain entry more quickly, but also bring a loss of control over service quality, customer service, and brand consistency.

One of the other strategic issues is channel conflict. With both direct and indirect routes, overlapping responsibilities can negatively impact efficiency, and customer ownership issues can arise (Pang and Yang, 2024). This is more than an operational concern. When customers primarily engage with the collector rather than the platform, the value seen might be the value of the collector rather than RenewWaste itself. If that's the case, the company could transact without establishing lasting client loyalty. However, prematurely scaling up the D2C channel could lead to financial risk if demand turns out to be lower than anticipated.

Practical experience proves that single-channel strategies are less effective in fragmented markets and that hybrid strategies offer more scalability and market access, while maintaining control and flexibility (Zhang et al., 2023). Hence, D2C and partnerships should not work in isolation. Collaborations with local collectors and SMEs (in Ikeja and Yaba) can lead to lower launch costs and faster adoption rates, but can also challenge customer ownership. On the other hand, D2C channels provide greater brand control and customer relationships but have a high logistics, marketing, and customer trust investment requirement.

Hence, a hybrid approach is more defensible. Customer acquisition should focus on ease of access and value to the buyer, and not on environmental messaging. Social media content that portrays genuine Lagos households using the platform can further establish a sense of authenticity, while messages like “scheduled pickup, instant payout, no hassle” can have a greater impact in price-sensitive markets (Alenazi, 2025). Nevertheless, incentives are not the only way to retain. Balancing affordability, operational reliability, scalability, and behavioural habit formation depends upon consistent service delivery and rewards over a long period of time.

Section 6: Sustainability and Ethics

Critical sustainability and ethics analysis must not remain symbolic alignment but go beyond “value creation.” RenewWaste is aligned with SDG 11 and SDG 12, which focus on making better

urban waste systems and promoting responsible consumption. But alignment is not enough to make an impact. Adesua-Lincoln (2025) has emphasised that Nigeria's sustainability efforts often suffer from poor implementation and infrastructure barriers. Therefore, the sustainability of the model is not the question, but whether it can deliver measurable results within the local context of operations.

Environmentally, the platform can contribute to a more effective collection rate and a reduction in reliance on landfill, thus promoting the circular economy goals. According to Etim (2024), a good waste system can produce environmental and economic benefits. However, this implies that service availability automatically translates to behaviour change; this is not guaranteed. Studies in urban African settings reveal that despite awareness of environmental issues, recycling is not consistently enacted, and that convenience is a factor that undermines intention. Therefore, the main environmental metric that must be measured is not just waste diversion rate (kg recycled/kg collected), although this is still the most common environmental measure that correlates with GRI 306.

A second measure would reflect behaviourally sustainable. RenewWaste can measure repeat participation by the percentage of users who have picked up at least 2 or 3 times a month for 6 months. Retention rates, repeat booking rate, and drop-off rates would be good indicators of whether recycling is becoming a habit or a single-time reaction to incentives. If not integrated into the behaviour, environmental impact might be exaggerated because early signups do not necessarily mean that the environmental impacts are ongoing.

Ethically, the role of informal waste collectors needs to be examined more. In Lagos, these actors are not a marginal group but are entrenched as market operators, with trusted networks and livelihood reliance. Any sustainable model without taking them into account is likely to encounter social exclusion, resistance, and duplication of already existing systems. Anyanwu et al. (2025) highlight the importance of involving informal actors in sustainable business models in developing economies, rather than replacing them.

Instead of competing, RenewWaste should partner with informal collectors as collection agents, neighbourhood coordinators or micro-franchise partners. This method helps retain livelihoods and enhances service accessibility and community legitimacy. Therefore, ethical sustainability

requires not just environmental results, but inclusive participation, protecting current economic actors and demonstrating measurable behavioural change in the long run.

Section 7: Launch Plan

According to lean startup principles, a critical launch plan should focus on validated learning rather than scaling. For RenewWaste, the Minimum Viable Product (MVP) cannot be limited to a simple mobile platform for collection requests and incentive tracking. The digital function is not enough to validate the value of an infrastructure-dependent sector without also testing its operational reliability (Laureti et al., 2024). Customers in Lagos are more likely to rely on the quality of the app than on the timeliness of pickups and consistency of rewards. Thus, the MVP should be tested from the very beginning with both the digital interface and logistics chain.

Figure 5: Key milestones with specific dates

Phase	Timeline	Success Metric
MVP development: app, payment integration, routing system, and collection workflow	Month 1	Platform functional, and 90% of test pickups have been completed on schedule.
Controlled pilot across two Lagos mainland wards with 50 households	Month 2	At least 70% of pickups were completed successfully, and 50% of users booked a second pickup.
Early growth phase with targeted SME onboarding	Month 3	100 active users and at least 60% repeat usage within four weeks
Expansion and strategic partnerships	Month 4	Stable weekly operations with no major service disruptions and two active collection partners

A staged approach ensures a better platform for assessment. Registration is not a valid measure of a pilot's success. Operational consistency, repeated participation and service reliability are essential for success under real conditions.

Table 5: Core resources required

Resource Type	Specific Item	How Secured
Staff	2 collection agents, 1 operations manager	Freelance contracts (months 1-3), employed from month 4
Technology	Flutterwave, Google Maps API, SMS fallback	Free tier initially, paid tier from month 3
Suppliers	Weighing scales, collection bags, baling equipment	Leased from Lagos Recyclers' Association

Scalability should be an option rather than a must. If the pickup completion rate is not meeting the target or there is little repeat use, expansion should be postponed until logistical issues are addressed. The staged launch helps to mitigate the risk in early operation and ensures that the tested model can also be considered as a long-term solution in the market. In real terms, this means identifying the areas where things are going wrong, missed pickups, inefficient routing, lack of communication with customers or lack of reward delivery, and fixing them before going into new markets. Failure to improve these weaknesses at this stage may risk loss of trust and decrease adoption rates in the future.

Section 8: Reflection

This project transformed my perspective on entrepreneurship from just being about ideas to having a strong emphasis on evidence and adaptability, and critical decision-making. At first, frameworks like the Value Proposition Design seemed to be very promising to describe customer needs and to organise value creation. However, the use of the framework in the context of waste management in the city of Lagos revealed important limitations. The Value Proposition Canvas assumes that the customer behaviour is relatively stable and rational, because the pains are resolved and gains are produced through services. In practice, the way waste is disposed of in Lagos is more influenced by convenience, habit, trust and informal systems of disposal than by clearly formulated value propositions. This showed that value to customers is not a product of theory or assumption, but is subject to ongoing and continual validation by engaging people in the real world and observing their behaviour.

Similarly, the Business Model Generation started to give clarity about income streams, cooperation and action. However, the framework was not as effective in a very dynamic and informal waste system. The Business Model Canvas depicts business models as more or less stable and structured, while the recycling environment in Lagos is constantly affected by infrastructural problems, informal waste collectors, irregular logistics and shifting customer participation. In doing so, I came to understand that business models in emerging markets become evolving systems and not plans.

The concept of lean startups also resonated with me, as it emphasised experimentation and learning through iteration. Nevertheless, the application revealed that the ability to iterate quickly is more challenging in an infrastructure-driven business where logistics, partnerships and reliability are constraints. Therefore, the key takeaway from this project is that frameworks can be important analytical tools, but cannot be solutions. They are effective when they are relevant to the context, continually tested, and can connect theory with practicalities.

Appendices

Appendix: Capstone pitch

Slide 1: RenewWaste: A Digital, Incentivised Recycling Platform for Urban Households and SMEs in Lagos, Nigeria

Slide 2 - Opening - The Pitch

Waste2Wallet

Opening - The Pitch

- Lagos generates over 13,000 tonnes of waste daily, yet structured, incentivised recycling remains limited.
- A digital platform offering scheduled waste collection and reward-based recycling.
- Targets middle-income households and SMEs in Ikeja, Yaba, Surulere, and Lekki.
- Revenue comes from subscriptions, recyclable sales, and sustainability partnerships.
- Provides formalised collection, real-time tracking, and instant rewards, with phased market launch from months one to four.

Good day. I am presenting Waste2Wallet, a digital platform solving Lagos's waste crisis. Lagos produces more than 13,000 tonnes of waste every day (Opanuga, 2025), and there is no incentivized and reliable mechanism for household waste to be recycled. That's why we offer airtime rewards, instant Naira payout, and a scheduled pickup. We focus on the middle class and SMEs in Ikeja, Yaba, Surulere, and Lekki, where waste collection costs exceed 5,000 naira per month. Our unique value proposition is turning waste into wallet, scheduled pickup, instant payout, and no hassle. We earn through SME subscriptions, selling recyclables, and brand partnerships. We are reliable, trackable, and pay right away, unlike informal collectors. Our milestones are MVP in month one, pilot in month two, one hundred users by month three, and full launch in month four. Each kilo recycled cleans your community and brings money to your pocket. Join us.

Slide 3 - Customer Jobs

 Waste2Wallet Customer Jobs	
Type of Job	Customer Need
Functional	Dispose of household and business waste conveniently without storage or odour issues
Functional	Access reliable and predictable waste collection services.
Emotional	Feel a sense of responsibility and contribution to a cleaner neighbourhood.
Social	Demonstrate environmental consciousness within their community and peer groups.

According to Osterwalder et al. (2014), the Value Proposition Canvas identifies three types of customer jobs: functional, emotional, and social. Waste2Wallet customers have three types of jobs. In practice, they should be able to get rid of the garbage easily without any storage or odour problems. They also require a reliable and predictable collection system, which does not currently exist. Emotionally, they want to feel a sense of responsibility and contribution to a cleaner neighbourhood. Socially, they want to show that they are environmentally aware in their community. Our platform is not only about the practical disposal issue but also covers all three dimensions.

Slide 4 - Customer Pains

Waste2Wallet
Customer Pains

- Irregular waste collection, leading to odour, accumulation, and health hazards
- No accountability or tracking when collection fails
- Health risks from prolonged waste storage and pest infestation
- No financial return for separating recyclable materials, despite paying for disposal

Using the Value Proposition Canvas framework (Osterwalder et al., 2014), customer pains are the frustrations and risks customers currently experience. Customer pains in Lagos are structural failures. Irregular collection is the norm, with no accountability when it fails. Customers face health risks and pay to dispose of items but don't get a monetary reward for recycling. Waste2Wallet solves these pains by offering scheduled collection, real-time tracking, and real-time payment.

Slide 5 - Customer Gains

Waste2Wallet

Customer Gains

A clean and healthy living environment with reduced waste accumulation (Schoeman and Rampedi, 2022)

Time saved through reliable, scheduled pickup without repeated follow-ups (Faiz et al., 2024)

Peace of mind from knowing waste is disposed of responsibly (Roberts-Lombard and Jaiyeoba, 2025)

Cash rewards for recycling, turning waste into a source of income (Ferronato and Torretta, 2022)

Social recognition within the community as environmentally conscious citizens (Etim, 2024)

Customer gains extend beyond financial incentives. According to Schoeman and Rampedi (2022), a clean living environment with reduced waste accumulation is a primary motivator. Ferronato and Torretta (2022) agree that cash incentives can convert waste to income, but only under certain market conditions. Faiz et al. (2024) found that time saved through reliable scheduled pickup is highly valued. Roberts-Lombard and Jaiyeoba (2025) prove that responsible disposal leads to peace of mind and trust. Finally, Etim (2024) shows that social recognition as environmentally conscious citizens matters in urban African communities. Waste2Wallet provides all five gains.

Slide 6 - Products and Services

Waste2Wallet
Product and Services

-  A mobile application for requesting waste pickup and tracking collection in real time 
-  Scheduled waste collection service with fixed weekly pickup times 
-  Weight-based instant Naira payment directly to user wallets within the app 
-  Mobile airtime rewards are redeemable through loyalty points accumulated over time 
-  SMS notification system for users without consistent smartphone access 

Waste2Wallet has five products and services connected with customer jobs identified in Slide 3. First, a mobile application for requesting waste pickup and tracking collection in real time, addressing the functional need for convenience. Secondly, scheduled waste collection service with fixed weekly collection days, which offers reliability. Third, weight-based instant Naira payment directly to user wallets within the app delivers the financial gain customers seek. Fourth, mobile airtime rewards redeemable through loyalty points, adding a retained incentive. Fifth, an SMS notification system for users without consistent smartphone access, ensuring digital inclusion. Together, these offerings transform waste disposal from a chore into an economically rewarding activity

Slide 7 - Pain Relievers

Waste2Wallet pain relievers are directly addressing each customer's pain point identified in Slide 4. Fixed weekly pickup schedules eliminate the uncertainty of irregular collection, which Osterwalder et al. (2014) identify as a core pain reliever function. Real-time tracking within the mobile app provides full accountability, a feature currently absent from informal systems. SMS notifications confirm pickup completion and payment status, ensuring transparency. Instant Naira payment upon each collection directly addresses the absence of financial return for recycling. Finally, designated waste containers provided to customers reduce storage odour and pest risks, mitigating health hazards. Collectively, these pain relievers transform waste collection from a frustrating, unreliable service into a predictable, accountable, and rewarding experience.

Slide 8 - Gain Creators

Waste2Wallet

Gain Creators

- Instant Naira payout calculated by weight immediately after each collection 
- Loyalty points redeemable for mobile airtime, encouraging repeat usage 
- Transparent weight measurement displayed within the app after each pickup 
- Monthly recycling reports showing environmental impact (kilograms diverted from landfill) 
- Recognition badges within the app for consistent recycling behaviour 

Gain creators are how Waste2Wallet delivers customer gains. Instant weight-based Naira payment after each collection turns waste into immediate income. Loyalty points redeemable for mobile airtime encourage repeat usage. Transparent weight tracking displayed in the app builds trust through verifiable data. Monthly environmental impact reports showing kilograms diverted from landfill address the emotional gain of contributing to a cleaner community. In-app recognition badges for consistent recycling deliver social recognition. Together, these gain creators transform recycling from an occasional chore into a habit reinforced by financial, informational, and social rewards.

Slide 9 - Reflection and Learning

Waste2Wallet

Conclusion

Two Greatest Challenges

- Integrating informal waste collectors without creating channel conflict or resistance, as these actors currently dominate Lagos waste collection and may perceive the platform as a threat to their livelihoods
- Achieving consistent user participation in a price-sensitive market where convenience and cost dominate decision-making over environmental awareness

Two Greatest Challenges

- Stakeholder negotiation to build trust and collaborative partnerships with informal collectors rather than displacing them
- Data analytics to track waste diversion metrics and user behaviour, enabling evidence-based decisions for improving retention and participation rates

Reflecting on this venture, I have identified two great challenges. First, integrating informal waste collectors without creating channel conflict or resistance. These actors currently hold the monopoly on waste collection in Lagos, and Waste2Wallet could be seen as a threat to their livelihoods. Second, achieving consistent user participation in a price-sensitive market where convenience and cost dominate decision-making over environmental awareness, as confirmed by [Ferronato](#) and [Torretta](#) (2022). To overcome these challenges, I need to develop two entrepreneurial skills. Negotiation with stakeholders to develop trust and partnerships with informal collectors without replacing them. Data analytics to monitor waste diversion metrics and user behaviours, allowing for informed decisions on enhancing retention and participation. These skills directly impact the conflict and measurement issues in the channel noted in my earlier report.
